

Nimbus Support Knowledge Base

About this document

This knowledge base documents the standard resolution procedures used by the Nimbus customer support team. Each section covers one request category, the diagnostic steps an agent should follow, the expected resolution time, and the conditions under which a request must be escalated to a senior engineer. Agents are expected to consult this document before responding to a customer.

1. Login Issues

A login issue is any failure that prevents an authenticated user from reaching their dashboard. The most common cause by a wide margin is an expired session token: Nimbus sessions are valid for thirty days, after which the refresh token is rejected and the user is returned to the sign-in screen without an explanatory message. Ask the customer to sign out fully and sign back in before investigating further. The second most common cause is a locked account. After five consecutive failed password attempts the account locks automatically for fifteen minutes. This lockout cannot be lifted manually by a support agent; the customer must wait. If the customer reports that the password reset email never arrives, check whether their address is on the bounce suppression list, which silently discards outbound mail after three hard bounces. Login issues are classified as High priority because they block all product usage. The target first response time is one hour, and the target resolution time is four hours. Escalate to the identity team if the customer uses single sign-on and the error mentions a SAML assertion, since those failures usually originate in the customer's own identity provider rather than in Nimbus.

2. Billing

Billing requests cover invoices, refunds, payment method failures and tax documentation. When a customer disputes a charge, first confirm which plan was active on the invoice date, because plan changes are prorated and a mid-cycle upgrade produces two line items that customers frequently read as a duplicate charge. Refunds within fourteen days of the charge can be issued by any support agent. Refunds beyond fourteen days, and any refund above five hundred dollars, require finance approval before they are processed. Failed card payments are retried automatically on days one, three and seven; the account is only suspended after the fourth failure. Billing requests are normally Medium priority, with a one business day response target. A billing request should be raised to High priority if the account is already suspended, because the customer is then also locked out of the product.

3. Technical Support

Technical support covers product defects, performance complaints and integration failures. Always collect the workspace identifier, the browser and version, and the approximate timestamp of the failure before escalating, because engineering cannot search the trace logs without a time window. Slow dashboard loads are most often caused by workspaces holding more than fifty thousand records, where the default unfiltered view attempts to aggregate the entire dataset; advising the

customer to apply a date filter resolves the majority of these reports immediately. Intermittent API timeouts are usually rate limiting rather than an outage: the public API permits one hundred requests per minute per token, and exceeding it returns HTTP 429 with a Retry-After header that many client libraries ignore. Technical support requests default to Low priority unless data loss or a full outage is involved, in which case they become Critical and page the on-call engineer immediately.

4. Account Access

Account access requests concern permissions and workspace membership rather than authentication itself. The distinction matters: a customer who can sign in but cannot see a project has an access problem, not a login problem, and routing it to the identity team wastes a cycle. Only a workspace owner can grant administrator rights, and Nimbus deliberately provides no mechanism for support staff to elevate their own permissions into a customer workspace. When the sole owner of a workspace has left the organisation, ownership transfer requires written confirmation from a verified company email domain plus a countersignature from the account's billing contact. Access requests are High priority when they block an entire team and Medium when they affect a single user. Guest accounts expire after ninety days of inactivity and must be re-invited rather than reactivated.

5. Subscription

Subscription requests cover upgrades, downgrades, seat changes and cancellation. Upgrades take effect immediately and are prorated for the remainder of the billing period. Downgrades are deliberately deferred to the end of the current period so that the customer keeps the features they have already paid for; this surprises customers who expect an immediate refund, and it should be stated explicitly in the response. Seats can be added at any time but can only be removed at renewal. A cancellation request should always trigger a retention conversation before it is processed: the most effective offer is a two month pause rather than a discount, which retains roughly a third of customers who would otherwise churn. Data is retained for thirty days after cancellation and is then permanently deleted, so any customer who wants an export must be told about that deadline in the cancellation confirmation. Subscription requests are Medium priority with a one business day response target.

6. Escalation Policy

Escalate immediately, regardless of category, when any of the following is true: the customer reports possible data loss, the customer reports a suspected security breach or unauthorised access, the request comes from an enterprise account with a contractual service level agreement, or the request has already been reopened twice. Escalation means assigning the request to the senior support queue and notifying the duty manager by email; it does not mean closing the request. The original agent remains the customer's point of contact until the matter is resolved.
